The output signals (pin 55) HBLK (15.6KHz) and (pin 56) VSYNC (59.2 Hz) of the Setax1-001, were simulated with the signal generator and an inverter. These were connected to the input pins of the Setax01-003 (pin 19 – 20), respectively.  
 No logic signals are observed on the output pins (22–23) HBLK – SYNC, applying Jotego's instructions, given in this issue.  
 It is concluded with Jotego that the Chip Setax1-001 is broken.
